Waste2Wear

Utilises technology to ensure traceability while turning plastic waste into fabric for clothing and other products.

By giving new life to plastic waste, Waste2Wear contributes to reducing environmental impact and fostering a circular economy in the textile industry.

Plastic Waste Collection
Waste2Wear collects plastic waste from post-consumer and post-industrial sources, including ocean bound plastics (within 50km's of the coastline)

Blockchain Technology
The company uses blockchain technology to ensure traceability by assigning unique identifiers to each batch of waste. Recording the journey step-by-step from plastic waste to finished textile products.

Traceability for the Consumer
QR codes are applied to the final products, allowing consumers to scan and trace the material's journey back to its original source.

Chain of Custody
This traceability promotes transparency, accountability, and confidence in the responsible and sustainable fabrics offered by Waste2Wear.

Scan & Trace the journey!
